

Information about possible pests in apartments.

There is a risk that you will get pests in your apartment some time. Here are some tips about what you can do to minimize the risk of attack.

- Clean your apartment thoroughly.
- Take out your trash often.
- Make sure to keep your kitchen clean from leftovers.
- Clean behind your stove and refrigerator.

Keep an eye out for unwelcome visitors. If you think you have pests in your apartment, contact Anticimex directly on +46470-709550! It is very important that you follow the instructions you get from Anticimex, if you don't you risk having to pay damages.

Examples of common pests are:

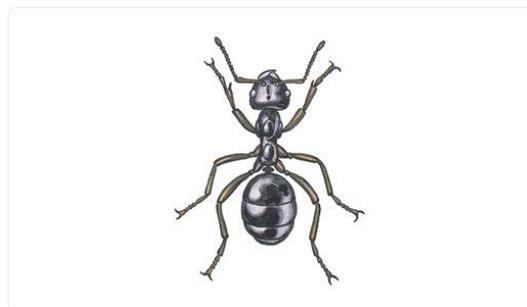

Cockroach, *Blattaria* or *Blattodea*:

There are many different kinds of cockroaches, but the most common one in Sweden is the German cockroach. A fully formed German cockroach grows to about 10 to 15 mm.

They are sensitive to light and hide during the day, which makes it difficult to know if your apartment is attacked by cockroaches or not. They often enter our homes with groceries and imported goods and they look for a warm and moist place, for example the kitchen or bathroom. Through pipes and power lines they easily spread in a building.

Ant, *Formicidae*:

A colony of black ants consist of a queen and workers (sterile females). They build their nests outside but they gladly come indoors during the spring and summer to look for food.

Black ants are about 2-4 mm.

Mice, *Murinae*:

A mouse gets in through a hole that is 6-7 mm wide. That is about the width of a pencil. A mouse can jump about 30 cm. A mouse grows to about 10 cm, not including the tail. A mouse is mature after three weeks.

Bedbugs, *Cimex lectularius*

A grown bedbug is about 4-5 mm long, about the same as the core of an apple, with a broad, oval flat body. The colour is a light yellow/brown to maroon after it has sucked blood. A bedbug empty of food can be almost translucent. The upper surface of the body is covered with short, golden hair growth that makes the bedbug look somewhat striped.

Beetles, *Attagenus pelli*:

Beetles are bugs whose larvae eat products with animal origin. The common beetle lives outside in all of Sweden. The other kinds have been brought to the country and occur only indoors. In nature their primary job is to clean. They specialize in processing hair products such as fur, down and feathers outside.

The bugs are all of oval, elongated shape, brown in different shades and patterns and they are about 3-6 mm long.

- You have an obligation to notify us immediately if you discover any type of pest, vermin or insect in the apartment or in another space.
- إذا اكتشفت وجود أي نوع من الحيوانات لضرارة أو الحشرات أو الهوام في الشقة أو في أي موقع آخر فعليك أن تقوم مباشرة بتبليغنا عن ذلك
